

PROOF — Bottle Intelligence Page Redesign

The page works. Now make it unforgettable.

THE PROBLEM

The current /bottles page looks like a data grid with dark cards. It is functional but generic. It could be any SaaS product with a dark theme. Nothing about it says "premium bourbon intelligence" or makes someone feel like they just walked into an exclusive tasting room. A paid member landing on this page should feel like they're accessing something worth 10x what they paid. Right now it feels like a free tier.

THE QUALITY BAR

Study these sites before writing a single line of code. This is the tier we are targeting:

- **Linear.app** — how they use restraint, whitespace, and micro-interactions to feel premium
- **Stripe.com/docs** — how they make dense data beautiful and scannable
- **Vercel.com/dashboard** — how dark UI can feel sophisticated, not just dark
- **Bloomberg Terminal** — how information density can feel powerful instead of cluttered

We are building the Bloomberg Terminal of bourbon. Dense, powerful, exclusive — but wrapped in a warm bourbon aesthetic instead of cold fintech blue.

BOTTLE CARD REDESIGN — THIS IS THE ENTIRE PAGE

The card is everything. If the card doesn't make someone stop scrolling, nothing else matters. Rebuild the BottleCard component from scratch with these requirements:

Tier visual hierarchy — cards must NOT all look the same:

- **Unicorn cards:** 3px top border in amber (#C4943A). Background tint: rgba(196,148,58,0.03). Faint ambient glow on hover: box-shadow 0 0 40px rgba(196,148,58,0.08). These are the crown jewels — they should radiate warmth.
- **Allocated cards:** 3px top border in copper (#B87333). Standard card-bg. No glow. Solid and respectable but clearly secondary to unicorn.
- **Limited cards:** 3px top border in muted silver (#8A8A8A). Slightly dimmer text opacity. These are the workhorses — reliable but not exciting.

Price intelligence block — the centerpiece:

- Wrap MSRP and secondary price in a dark inset block (rgba(0,0,0,0.25), border-radius 8px, padding 16px) — this creates a "data card within a card" that signals this is premium intel
- MSRP: label in tiny muted uppercase, price in JetBrains Mono 20px, cream color
- Add a literal "vs" between MSRP and secondary in tiny italic muted text

- Secondary: label in tiny amber uppercase, price in JetBrains Mono 16px, amber color
- **MULTIPLIER BADGE:** This is the single most important visual element on the entire page. A pill showing "10x" or "15x" in tier-colored style (amber bg for unicorn, copper for allocated). Font: JetBrains Mono, bold. Size: large enough to be the first thing your eye lands on. Position: right-aligned within the price block. For free users, blur the badge at 3px — they should see SOMETHING is there but not the number.

Rarity indicator:

- Replace plain text "Very rare" with a styled pill: dark bg, colored border matching tier, colored text. Pill border-radius 10px, padding 2px 8px.
- Rarity levels with tier styling: "Very rare" = amber, "Rare" = copper, "Uncommon" = muted, "Common" = dim gray

Card interactions — make them feel alive:

- Hover: translateY(-4px) + box-shadow increase + border color shift to --color-card-border-hover. Use Framer Motion spring physics (stiffness: 300, damping: 20), not CSS transition.
- Stagger reveal: cards fade up in sequence using staggerContainer + fadeUpVariant. 0.08s stagger between cards. They should cascade like dominos, not pop in all at once.
- The expand arrow in the footer should rotate 90 degrees on hover (Framer Motion animate).

FILTER BAR — MUST FEEL LIKE A TOOL, NOT A FORM

- **Search input:** dark bg (var(--color-card-bg)), 1px border (var(--color-card-border)), border-radius 10px, padding 12px 16px 12px 40px. Lucide Search icon absolutely positioned inside left. On focus: border-color animates to var(--color-amber-rich), subtle amber glow shadow. Placeholder text in --color-text-tertiary.
- **Tier pills:** Active = filled amber bg (#C4943A) + dark text (#1A1510) + border-radius 20px. Inactive = transparent bg + 1px border rgba(255,255,255,0.08) + muted text. Spring transition between states (Framer Motion layout animation). Each pill shows count: "Unicorn (12)"
- **Sort:** Replace native select with a custom dark dropdown. Trigger button styled like a pill. Dropdown panel: dark bg, amber border, appears below with Framer Motion (scale from 0.95, opacity from 0, 200ms). Options highlight on hover with rgba amber bg.
- **Sticky behavior:** bar sticks below nav on scroll with glass/blur background matching nav (backdrop-filter: blur(16px), same bg as nav scrolled state). Add a 1px bottom border in --color-card-border when sticky.

PAGE HEADER

- Add 120px top padding minimum to clear the fixed nav
 - Add eyebrow: "BOTTLE INTELLIGENCE" in standard amber uppercase treatment above title
 - Title "The Library" in Fraunces (--font-playfair), centered
 - Below the tracking count, add a subtle ambient glow (radial-gradient, same as hero section) centered behind the title to create depth
-

CONVERSION BLUR WALL

- After 6 fully visible cards, progressively blur cards 7+ (blur 2px, 4px, 6px)
 - Overlay a centered CTA block on top of the blur zone:
 - — Heading: "Unlock the full library" in Fraunces, 28px, cream
 - — Subtext: "Access secondary market data, drop history, and watchlists for 43+ bottles" in DM Sans, muted
 - — Two buttons: "Start Hunting — \$10/mo" (ghost style) and "Claim Your Spot — \$69" (solid amber). Link to #pricing.
 - Free user blur on secondary prices: reduce to blur(3px) so the magnitude is visible but not readable
-

BOTTLE DETAIL PANEL

- Slide-in panel from the right (Framer Motion: x starts at 100%, animates to 0, spring physics)
 - Semi-transparent dark overlay behind (rgba(0,0,0,0.5), click to close)
 - Panel width: 480px on desktop, full-width on mobile
 - Contents: enlarged bottle name + distillery, full price intelligence block, tasting profile tags (amber-outlined pills), drop history mini-timeline (thin amber line + dots), watchlist toggle button
 - The drop history timeline should feel like a mini version of the How We Hunt section — vertical amber line with small circle markers at each drop event
-

PROOF — Self-Critique Loop Protocol

Build. Screenshot. Critique. Fix. Repeat.

HOW THIS WORKS

After completing the bottle page redesign, do NOT call it done. Run this self-critique loop before presenting the result. This is mandatory — not optional.

Step 1: Build

Implement all changes from the redesign prompt above.

Step 2: Screenshot

Take a full-page screenshot of the /bottles page at 1440px viewport width. Also take a mobile screenshot at 375px width.

Step 3: Critique against this checklist

Review your own screenshot and honestly answer every question:

Visual hierarchy:

- Can I immediately tell which bottles are unicorn vs allocated vs limited without reading the badge text?
- Does the multiplier badge (10x, 15x) jump out as the most prominent data point on each card?
- Do unicorn cards feel visually warmer/more special than allocated cards?
- Is there enough contrast between the card background and the price intelligence block inside it?

Premium feel:

- Would this page look out of place on Linear.app or Vercel's dashboard? If yes, it's not premium enough.
- Does the search input look styled or does it look like a raw HTML input?
- Do the filter pills look like clickable UI elements or plain text with circles?
- Is the sort dropdown styled or is it a native browser select?
- Does the page use the Fraunces serif font for bottle names? (Check — this is often missed)
- Is JetBrains Mono used for all numerical data (prices, proof, multipliers)?

Spacing and breathing room:

- Is there at least 120px between the nav and the page title?
- Is there at least 24px gap between cards in the grid?

- Is there at least 24px padding inside each card?
- Is there at least 32px between the filter bar and the first row of cards?
- Does the page feel cramped anywhere? If yes, add more space.

Animations:

- Do cards stagger in on scroll (not all appear at once)?
- Do cards lift on hover with a spring animation (not a stiff CSS transition)?
- Does the detail panel slide in from the right with spring physics?

Conversion mechanics:

- Are secondary prices blurred at exactly 3px (not heavier)?
- Is the blur wall CTA visible and compelling over the blurred cards?
- Can a free user see enough to want more but not enough to get the value for free?

Step 4: Fix

For every checklist item where the answer is "no" or "not sure", fix it. Do not present the page until every answer is "yes".

Step 5: Second pass

After fixing, take new screenshots. Run the checklist again. If any item still fails, fix again. Maximum 3 iterations — if it's not right after 3 passes, present what you have and flag the remaining issues.

THE STANDARD

The /bottles page should make a bourbon hunter feel like they just got access to something that nobody else has. The data is the product. The design is the proof that the data is worth paying for. If the page doesn't make someone want to pull out their credit card, it's not done.

Do not add new npm packages. Use only what exists in package.json. Do not create server components. All components must use "use client".
