

PROOF — Phase 1, Prompt 3 of 6

Member Dashboard • /dashboard

CONTEXT

This is the **member dashboard** — the home screen for paying Proof subscribers. When a member logs in, this is where they land. It is the command center for their bourbon hunting: live alerts, personal watchlist, drop activity stats, and quick access to everything they care about.

This page must feel like a mission control for bourbon hunters. Think Bloomberg Terminal warmth — dense with useful data, but organized so a glance tells you everything you need. Not a marketing page. Not a settings page. An intelligence dashboard.

Quality bar: Linear.app's project views, Vercel's deployment dashboard, Stripe's payments overview. Information-dense but never cluttered. Every pixel earns its place.

DESIGN SYSTEM

Use all existing design tokens from `globals.css`. Never hardcode hex. Fonts: `--font-playfair` (Fraunces) for headings, `--font-dm-sans` (Plus Jakarta Sans) for body/UI, `--font-jetbrains` (JetBrains Mono) for numbers/data/timestamps. Use existing animation variants from `@/lib/animations`. Import Navigation and Footer from existing components.

PAGE STRUCTURE

Route: `src/app/dashboard/page.tsx`

Access: Members only. For now, simulate logged-in state (no auth system yet).

Layout: Full-width page, no sidebar nav. Content in a centered max-width container (1200px). Generous top padding (120px+) to clear fixed nav.

Section 1: Greeting + Quick Stats

The top of the dashboard. Personal, warm, and immediately useful.

Greeting row:

- Left side: "Welcome back" in Fraunces 32px, cream. Below it: current date/time in DM Sans 13px, muted, using JetBrains Mono for the timestamp
- Right side: a small "Member since Mar 2026" badge and the member tier pill ("BOTTLED IN BOND" or "STANDARD PROOF") styled like the tier badges on bottle cards

Stats row (4 metric cards in a horizontal grid):

Use the existing StatCard component pattern (count-up animation on scroll into view). 4 cards in a row on desktop, 2x2 on tablet, stacked on mobile.

- **Drops Today** — number of drop events in the last 24 hours. Computed from drops.json. Icon: small amber dot with pulse animation if > 0
- **Bottles Tracked** — total bottles in the user's watchlist. Static placeholder for now (e.g. 8). Icon: eye or bookmark
- **Active Counties** — how many NC counties had drops this week. Computed from drops.json. Icon: map pin
- **Unicorn Alerts** — unicorn-tier drops in the last 7 days. Computed from drops.json. Icon: diamond or star

Card style: dark inset bg (rgba(0,0,0,0.2)), border-radius 12px, padding 20px. Number in JetBrains Mono 28px amber. Label in DM Sans 12px muted below. Subtle amber left border (3px) on each card. Hover: slight lift + border glow.

Section 2: Live Alert Feed

The core of the dashboard. A real-time feed of drop events, styled like the landing page drop feed but with full data (no blur, no paywall). This is the paid experience.

Layout:

- Takes up roughly 60% of the width in a two-column layout (feed left, sidebar right) on desktop
- Section header: "Live Feed" with a small green pulsing dot indicating live status
- Below header: filter pills for tier (All / Unicorn / Allocated / Limited) — same style as bottles page

Feed items:

- Reuse the same drop card pattern from the landing page DropFeed — tier-colored left border, bottle name in Fraunces, description line, timestamp in JetBrains Mono
 - Full data visible: secondary price, multiplier badge, county/store details all unlocked
 - Expandable: click a drop to see store addresses, quantities, county breakdown
 - New drops slide in from top with Framer Motion (same as landing page animation)
 - Scrollable container: max-height ~600px with custom amber scrollbar (use existing .drop-feed-scroll class from globals.css)
 - Show 20 most recent drops. Load from drops.json.
-

Section 3: Right Sidebar

The sidebar sits next to the live feed on desktop. It contains the personal watchlist and a quick-look panel.

My Watchlist:

- Header: "My Watchlist" with a small edit/manage link

- A compact list of bottles the user is watching. Each entry: bottle name (Fraunces 14px), tier dot, and last drop date (JetBrains Mono 11px, muted)
- If a watched bottle has dropped in the last 24 hours, highlight the row with a subtle amber bg pulse and a "NEW" pill badge
- Placeholder data for now: 5-8 bottles pre-populated (Pappy 23, Blanton's, Weller 12, EH Taylor, Eagle Rare, etc.)
- "+ Add Bottle" button at the bottom — ghost style, amber text
- Max-height with scroll if needed

Drop Trends Panel:

- Below the watchlist: a small "Drop Trends" card
- A mini bar chart showing drop volume by day for the last 7 days
- Use a simple CSS/SVG bar chart — 7 vertical bars, height proportional to drop count that day, amber fill, dark track behind each bar
- Day labels below each bar (Mon, Tue, etc.) in JetBrains Mono 10px, muted
- Below the chart: "X drops this week" in JetBrains Mono, small
- Do NOT import a charting library. Build with plain divs or inline SVG.

Section 4: Recent Activity Timeline

Below the feed+sidebar two-column layout. A full-width timeline showing recent notable events.

- Vertical timeline with small amber dots on a thin line (similar to How We Hunt still section)
- Events: "Pappy Van Winkle 23 dropped in Wake County" / "You added Blanton's Gold to your watchlist" / "King of Kentucky shipped to 7 NC counties"
- Each event: timestamp (JetBrains Mono, muted), description (DM Sans), tier dot
- Show last 10 events. Mix of system events (drops) and user actions (watchlist changes)
- Placeholder/simulated data for now
- Staggered scroll reveal (fadeUpVariant)

MOBILE DESIGN (375PX — 768PX)

Mobile is not an afterthought. Many bourbon hunters will check Proof on their phone the moment they get a drop alert. The dashboard must be fully usable at 375px.

Breakpoints:

- **Desktop:** 1024px+ — two-column layout (feed 60% / sidebar 40%), stats in a 4-column grid
- **Tablet:** 768px–1023px — two-column layout with tighter gaps, stats in a 2x2 grid
- **Mobile:** below 768px — everything single-column, stacked vertically

Mobile layout (below 768px), top to bottom:

- **Greeting:** Stack vertically — "Welcome back" on top, member tier pill and date below. Reduce title to 24px. Full width.
- **Stats:** 2x2 grid with 12px gap. Each card takes 50% width. Reduce number font to 22px. Keep count-up animations.
- **Live Feed:** Full width, no sidebar beside it. Reduce max-height to ~400px or remove max-height and let it scroll naturally. Feed items: bottle name 15px, reduce internal padding to 12px 16px. Tier filter pills: horizontally scrollable row if they don't fit (overflow-x: auto, no wrapping, hide scrollbar with CSS).
- **Watchlist:** Stacks BELOW the feed as its own full-width section. Reduce bottle name to 13px. Keep the "NEW" pill badge but make it smaller (font-size 9px).
- **Drop Trends chart:** Full width below watchlist. Bar chart works fine at full width — just make bars wider.
- **Activity Timeline:** Full width. Timeline line and dots shift to left edge with 16px left padding. Text to the right of the line. Timestamps above event text, not beside it.

Mobile-specific rules:

- All interactive elements must have at least 44px touch target
- No horizontal scroll on the page itself — only inside intentional scroll containers (feed, filter pills)
- Cards and sections: 16px horizontal page padding (not 48px like desktop)
- Reduce all section gaps from 48-64px (desktop) to 32-40px on mobile
- Feed item expand/collapse: full-width drawer below the item, not a side panel
- The watchlist "+ Add Bottle" button should be full-width on mobile
- Test: hold your thumb over the bottom-center of the screen. Can you reach the most important action? If not, consider reordering.

DATA HANDLING

All dashboard data comes from the existing `src/data/drops.json` file. Compute stats client-side. For the watchlist and user-specific data, use local state (useState/Zustand) with hardcoded placeholder data. No backend/API calls yet.

Stats computation from drops.json:

- Drops Today: filter by timestamp within last 24 hours, count unique grouped drops
- Active Counties: extract unique `board_name` values from last 7 days of drops
- Unicorn Alerts: filter by `rarity_tier === 'unicorn'` within last 7 days
- Weekly trend: group drops by day for last 7 days, count per day for the bar chart

Import and reuse data processing functions from `DropFeed.tsx` where possible (`cleanBrandName`, `getDisplayname`, `groupDrops`, `formatRelativeTime`). Consider extracting shared utilities into `src/lib/drops.ts` if it makes the code cleaner.

NAVIGATION INTEGRATION

- Update the "Dashboard" link in Navigation.tsx from "#" to "/dashboard"
 - Add active state styling on the nav link when on /dashboard
-

DESIGN PHILOSOPHY

The dashboard is where the member spends 90% of their time. It needs to feel like home — warm, organized, and instantly useful. Not a marketing page that happens to show data.

Do:

- Prioritize information density — a member should see 5+ useful data points above the fold
- Use JetBrains Mono everywhere numbers appear — it signals precision and a data-first product
- Make the live feed feel alive: pulse animations on new drops, smooth slide-in transitions
- Use subtle section dividers — thin lines, spacing changes, background shade shifts — not heavy headers
- The watchlist should feel personal — "these are MY bottles" not a generic list
- Vary the visual treatment between sections

Do not:

- Do not add a sidebar navigation — keep the existing top nav
 - Do not use the GlassCard component for everything — build custom styled sections
 - Do not add charts that require external libraries — build with CSS/SVG
 - Do not make it feel like a generic admin panel
 - Do not use gradient text on headings
 - Do not add features not described here
-

FILES TO CREATE / MODIFY

Create:

- src/app/dashboard/page.tsx — Main dashboard page
- src/components/sections/DashboardStats.tsx — Greeting + 4 stat cards
- src/components/sections/DashboardFeed.tsx — Live alert feed
- src/components/sections/DashboardSidebar.tsx — Watchlist + trend chart
- src/components/sections/ActivityTimeline.tsx — Recent activity timeline
- src/lib/drops.ts — Shared drop data utilities (optional extract from DropFeed.tsx)

Modify:

- src/components/Navigation.tsx — Update Dashboard link href to "/dashboard"

Do not add new npm packages. Do not create server components. All components use "use client". All colors via CSS variables. All data computed client-side from drops.json.
