

PROOF — Cohesion Pass C

New Cohesion Features

GOAL

Add the features that make Proof feel like one living product instead of five separate pages. These are the connective tissue — the elements that follow the user across every page.

***Prerequisites:** Cohesion Pass A (cross-linking) and Pass B (visual audit) should be completed first. This pass builds on top of both.*

FEATURE 1: PERSISTENT WATCHLIST INDICATOR IN NAV

Add a small watchlist icon to the Navigation component that appears on every page.

- Position: in the nav's right-side section, between "Sign In" and "Get Access" (or replacing "Sign In" for logged-in state)
- Icon: Lucide Bookmark or Bell icon, 20px, color `var(--color-text-secondary)`
- Count badge: if watched bottles have new drops (last 24h), show a small amber circle with the count overlapping the icon's top-right corner (classic notification badge). Font: JetBrains Mono 9px, dark text on amber bg, min-width 16px, centered.
- No new drops: icon only, no badge, muted color
- On click: dropdown panel appears below the icon (Framer Motion, scale from 0.95 + opacity, 200ms)

Dropdown panel contents:

- Dark glass bg (matching nav scrolled state), border `var(--color-card-border)`, border-radius 12px, width 320px, max-height 400px with scroll
- Header: "Watchlist" in DM Sans 14px bold
- List of watched bottles: name (Fraunces 13px) + tier dot + last drop date (JetBrains Mono 10px)
- Bottles with new drops highlighted with amber bg tint and "NEW" pill
- Each bottle links to `/bottles?highlight={id}`
- Footer: "Manage Watchlist" link to `/dashboard`
- Empty state: "No bottles watched yet" + "Browse The Library" link

Uses the Zustand watchlist store from Pass A. Cross-references watched bottle IDs with `drops.json` to determine which have new activity.

FEATURE 2: 'LAST UPDATED' HEARTBEAT

Every page that shows live data should display when it was last refreshed. This builds trust that Proof is actively monitoring.

- Create a small reusable `DataFreshness` component

- Visual: a small green dot (6px circle, #2D6A4F matching `var(--color-success)`) with CSS pulse animation + "Data as of [time]" in JetBrains Mono 11px, muted
- Time: reads the `lastUpdated` field from `drops.json` and formats as relative time
- Placement: top-right area of each page's content section, near the eyebrow/title area

Pages that get this component:

- Landing page drop feed section (near the feed header)
- Dashboard (near the greeting row)
- Map (inside the left overlay panel, near the stats)
- Bottles page is static reference data, so it does NOT get this indicator

FEATURE 3: PAGE TRANSITIONS

Add a subtle transition when navigating between pages so the app feels like one continuous experience.

- Wrap the page content in each route's `page.tsx` with Framer Motion's `motion.div`
- Animation: fade in (opacity 0 → 1) + slight upward slide (`y: 12 → 0`), duration 0.35s, ease-out
- Apply to: every `page.tsx` (landing, bottles, dashboard, map)
- The nav and footer should NOT animate — they stay fixed. Only the main content area transitions.
- Keep it subtle — the transition should feel smooth and fast, not dramatic

Implementation: wrap the `<main>` content in each page with `<motion.div initial={{opacity:0, y:12}} animate={{opacity:1, y:0}} transition={{duration:0.35, ease:'easeOut'}}>`. This is the simplest approach that works with Next.js App Router without needing `AnimatePresence` at the layout level.

FEATURE 4: DASHBOARD MINI-MAP

Add a small static map preview to the dashboard sidebar, below the Drop Trends chart.

- Size: full sidebar width, ~200px tall
- Non-interactive: no scroll, no zoom, no click. Just a visual snapshot.
- Show NC centered at the same default position as the full Hunt Map
- Render the same `CircleMarker` dots showing today's active stores (hot markers only)
- Below the map: "X stores active" in JetBrains Mono 11px, and a "View Hunt Map →" link to `/map`
- Use the same dynamic import pattern (no SSR) as the main map page
- CartoDB Dark Matter tiles, same as the full map
- Border-radius 12px to match card styling, overflow hidden

This is a lightweight visual reinforcement that Proof is a spatial tool. It takes 2 seconds to glance at and immediately shows activity.

FEATURE 5: UNIFIED TOAST NOTIFICATIONS

Create a toast notification system that works across all pages for user actions.

- Create `src/components/Toast.tsx` — a global toast component
- Create `src/lib/toast.ts` — Zustand store for toast state
- Position: top-right of viewport, below nav (top: 80px, right: 24px)
- Styling: dark glass bg (matching nav), border `var(--color-card-border)`, border-radius 12px, padding 14px 20px
- Amber left accent border (3px) for success actions
- Text: DM Sans 13px, cream. Small icon on the left (Lucide).
- Animation: slide in from right + fade (Framer Motion), auto-dismiss after 3 seconds

Trigger on these actions:

- "Added to watchlist" when user watches a bottle (with bottle name)
- "Removed from watchlist" when user unwatches
- "Filters applied" when tier filter changes on bottles or map (optional, subtle)

Render the Toast component in the root layout (`src/app/layout.tsx`) so it persists across all pages. Import the Zustand toast store wherever actions are triggered.

FILES TO CREATE / MODIFY

Create:

- `src/components/WatchlistDropdown.tsx` — Nav watchlist dropdown
- `src/components/DataFreshness.tsx` — Last updated indicator
- `src/components/DashboardMiniMap.tsx` — Small static map for dashboard
- `src/components/Toast.tsx` — Global toast notification component
- `src/lib/toast.ts` — Zustand toast store

Modify:

- `src/components/Navigation.tsx` — Add watchlist icon + dropdown
- `src/app/layout.tsx` — Add Toast component to root layout
- `src/app/page.tsx` — Add page transition wrapper + DataFreshness
- `src/app/bottles/page.tsx` — Add page transition wrapper
- `src/app/dashboard/page.tsx` — Add page transition wrapper + DataFreshness + MiniMap in sidebar
- `src/app/map/page.tsx` — Add page transition wrapper
- `src/components/BottleDetail.tsx` — Trigger toast on watchlist toggle

Do not add new npm packages. Zustand (already installed) handles all new state. Framer Motion (already installed) handles all new animations.
